Expression cassettes comprising a polynucleotide encoding autigenic type c human immunodeficiency virus (HIV) Gag or Env polypeptides are useful in DNA immunization, generation of packaging cell lines and production of Gag- and/or Env-containing proteins. Synthetic Env and Gag expression cassettes exhibit increased potency for induction of cytotoxic T-lymphocyte (CTL) responses by DNA immunization. Gag of HIV-1 self-assemble into non-infectious virus-like particles which are used as a matrix for the proper presentation of an antigen entrapped or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   540

production of Gaq- and/or Env-containing proteins, Synthetic Env and Gaq expression cassettes exhibit increased potency for induction of cytotoxic T-lymphocyte (CTL) responses by DNA immunization. Gag of HIV-1 self-assemble into non-infectious virus-like particles which are used as a matrix for the proper presentation of an antiqen entrapped or associated to the immune system of the host.
                                                                                                                                                                                                                                                                                                                                                                             Expression cassettes comprising a polynucleotide encoding antigenic type C human immunodeficiency virus (HIV) Gag or Env polypeptides are useful in DNA immunization, generation of packaging cell lines and

production of Gag- and/or Env-containing proteins. Synthetic Env and Gag expression cassettes exhibit increased potency for induction of cytotoxic T-lymphocyte (CTL) responses by DNA immunization. Gag of HIV-1 self-assemble into non-infectious virus-like particles which are used as a matrix for the proper presentation of an antigen entrapped or associated to the immune system of the host.

```
The present sequence is the coding sequence of a HIV Gag expression cassette, Gag.ModSF2. The Gag protein of HIV is needed for the assembly of virus-like particles. In addition, the Gag protein is involved in many stages of the HIV life cycle, including assembly, virion maturation after particle release and early post-entry steps in viral replication. The expression cassette may be used for the recombinant expression of HIV Gag-polypeptides which may then be used to vaccinate against HIV

The present invention relates to synthetic HIV Gaq and Env expression cassettes. The Gaq protein of HIV is needed for the assembly of virus-like particles. In addition, the Gaq protein is involved in many stages of the HIV life cycle, including assembly, virion maturation after particle release and early post-entry steps in viral replication. The

Gag-and Env-polypeptides which may then be used to vaccinate against HIV Gag-and Env-polypeptides which may then be used to vaccinate against HIV sequence is a synthetic construct constructed in the generation of the expression cassettes of the present invention. This construct is bicistronic in that the coding sequences for Env and Gag are under the control of a single CMV promoter and between the two coding sequences an Internal Ribosome Entry Site (IRES) is present.
                                                                                                                                                                                                                                                   The present invention relates to synthetic HIV Gag and Env expression cassettes. The Gag protein of HIV is needed for the assembly of virus-like particles. In addition, the Gag protein is involved in many stages of the HIV life cycle, including assembly, virion maturation after particle release and early post-entry steps in viral replication. The expression cassettes may be used for the recombinant expression of HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3375 ctggagaagatcgaggaggagcagaacaagtccaagaagaaggcccagcaggccgccgcc 3434

The present invention relates to synthetic HIV Gaq and Env expression cassettes. The Gaq protein of HIV is needed for the assembly of virus-like particles. In addition, the Gaq protein is involved in many stages of the HIV life cycle, including assembly, virion maturation after particle release and early post-entry steps in viral replication. The expression cassettes may be used for the recombinant expression of HIV Gaq- and Env-polypeptides which may then be used to vaccinate against HIV infection and acquired immanuabliciency syndrome (ALDS). The present sequence is a synthetic construct constructed in the generation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  expression cassettes of the present invention. This construct is bicistronic in that the coding sequences for Env and Gaq are under the control of a single CMV promoter and between the two coding sequences an Internal Pibeseme Entry Site (IRES) is present

The present invention relates to synthetic HIV Gag and Env expression cassettes. The Gag protein of HIV is needed for the assembly of virus-like particles. In addition, the Gag protein is involved in many stages of the HIV life cycle, including assembly, virion maturation after particle release and early post-entry steps in viral replication. The expression cassettes may be used for the recombinant expression of HIV Gag- and Env-polypeptides which may then be used to vaccinate against HIV infertion and acquired immunodeficiency syndrome (AIDS). The present sequence is a synthetic constructed in the generation of the expression cassettes of the present invention. This construct is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        bicistronic in that the coding sequences for Env and Gag are under the control of a single CMV promoter and between the two coding sequences an Internal Ribosome Entry Site (IRES) is present.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4596 alegacaaggagetglaceenetgaceageetgegeageetglteggeaasgaceecage 4655

```

```
The present sequence is a HIV GaqZHepatitis C virus (HCV) core fusion coding sequence. The Gaq protein of HIV is needed for the assembly of virus-like particles. In addition, the Gag protein is involved in many stages of the HIV life cycle, including assembly, virion maturation after particle release and early post-entry steps in viral replication. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present invention relates to synthetic HIV Gag expression cassettes. The present sequence was cloned and used to generate the expression cassettes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of the present invention. The expression eassettes may be used for the recombinant expression of HIV Gaq-polypeptides which may then be used to vaccinate against HIV infection and acquired immonedaticiency syndrome
                                                                                                                                                                                                                                                                                             1303 cecagecacauquqeeqeeccqgcaartteetqeaggeaqeeqeeee 1362

```

```
The present sequence is the coding sequence of a HIV Gag-protease expression cassette, GagProt.ModS. The Gag protein of HIV is needed for the assembly of virus-like particles. In addition, the Gag protein is involved in man, stages of the HIV life cycle, including assembly, it is maturation after particle release and early post-entry steps in viral replication. The expression cassette may be used for the recombinant expression of HIV Gag-polypeptides which may then be used to vaccinate
                                                                                                                                                                                                                                                                                                                       against HIV infection and acquired immunodeficiency syndrome (ALDS).
Jaq-rontaining polypeptide useful for vaccinating against HIV
                        intections and acquired immunodeficiency syndrome (AIDS)
                                                                           Maim 5; Fig 7; 491pp; English.

the present sequence is the coding sequence of a HIV Gag protease expression cassette, GagProtMod.SF2 (GP1). The Gag protein of HIV is needed for the assembly of virus-like paiticles. In addition, the Gag protein is involved in many stages of the HIV life cycle, including assembly, viriou maturation after particle release and early post-entry steps in viral replication. The expression cassette may be used for the recombinant expression of HIV Gag-polypeptides which may then be used to vaccinate against HIV infection and acquired immunodeficiency syndrome
                                                                                                                                                                                                 Expression cassettes encoding the human immunodeficiency virus (HIV) Gag-containing polypeptide useful for vaccinating against HIV

Expression cassettes encoding the human immunodeficiency virus (HIV) dag-containing polypeptide useful for vaccinating against HIV intections and acquired immunodeficiency syndrome (AIDS) -Claim 5; Fig 70; 391pp; English

Selby M, Walker C;

dreer C,

WPI; 2000-452400/39.

The present sequence is the ending sequence of a HIV Gag-protease expression cassette, GagprotMod.SF2(GF2). The Gag protein of HIV is needed for the assembly of virus-like particles. In addition, the Gag protein is involved in many stages of the HIV life cycle, including assembly, virion maturation after particle release and carly post-entry steps in viral replication. The expression cassette may be used for the recombinant expression of HIV Gag-polypeptides which may then be used to vaccinate against HIV intection and acquired immunodeficiency syndrome. (NIDS).

comprising the coding sequence for a beterologous envelope protein and a third retroxinal nucleotide sequence comprising a DNA sequence of interest and lentivirus, preferably HIV, cis acting sequences required for packaging, reverse transcription and integration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the patent discloses new packaging cell line for producing a viral accessory protein independent lentivirus, preferably buman immunodeficiency virus (HIV), derived retroviral vector particles. The packaging cell line comprises a mammalian cell, a retroviral DNA comprising a coding sequence for a letticitis, preferably HIV, gagpel, where the coding sequence has been mutagenised to improve expression of the viral gagpol proteins, a second retroviral nucleotide sequence
